

Simulation of Biological Systems

Day 8 – Computer Exercises: Computation of Absorption Spectra

Gustavo Cardenas

gustavo.cardenas@uam.es

Department of Chemistry, Autonomous University of Madrid

$$\Delta G_{red} = \langle E_R \rangle - \langle E_O \rangle - [\Delta G_{e,solv}]$$

Should actually be

Ensemble Averages

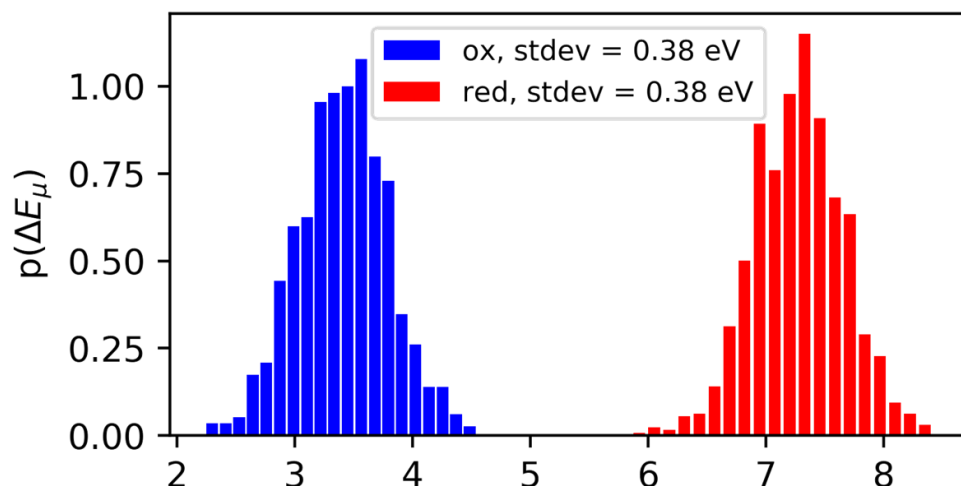

Solvated e^-

$$\Delta G_{red} \approx \langle E_R \rangle - \langle E_O \rangle - [\Delta G_{e,solv}]$$

Assuming small variations in V and S

$$A_R - A_O \approx \langle E_R \rangle - \langle E_O \rangle$$

Helmholtz Free Energies

A can be computed by using the vertical energy differences ΔE as the reaction coordinate

$$\Delta A_R = -k_B T \ln(p(\Delta E_{\mu,R}))$$

$$\Delta A_O = -k_B T \ln(p(\Delta E_{\mu,O}))$$

Derivation of the working equations

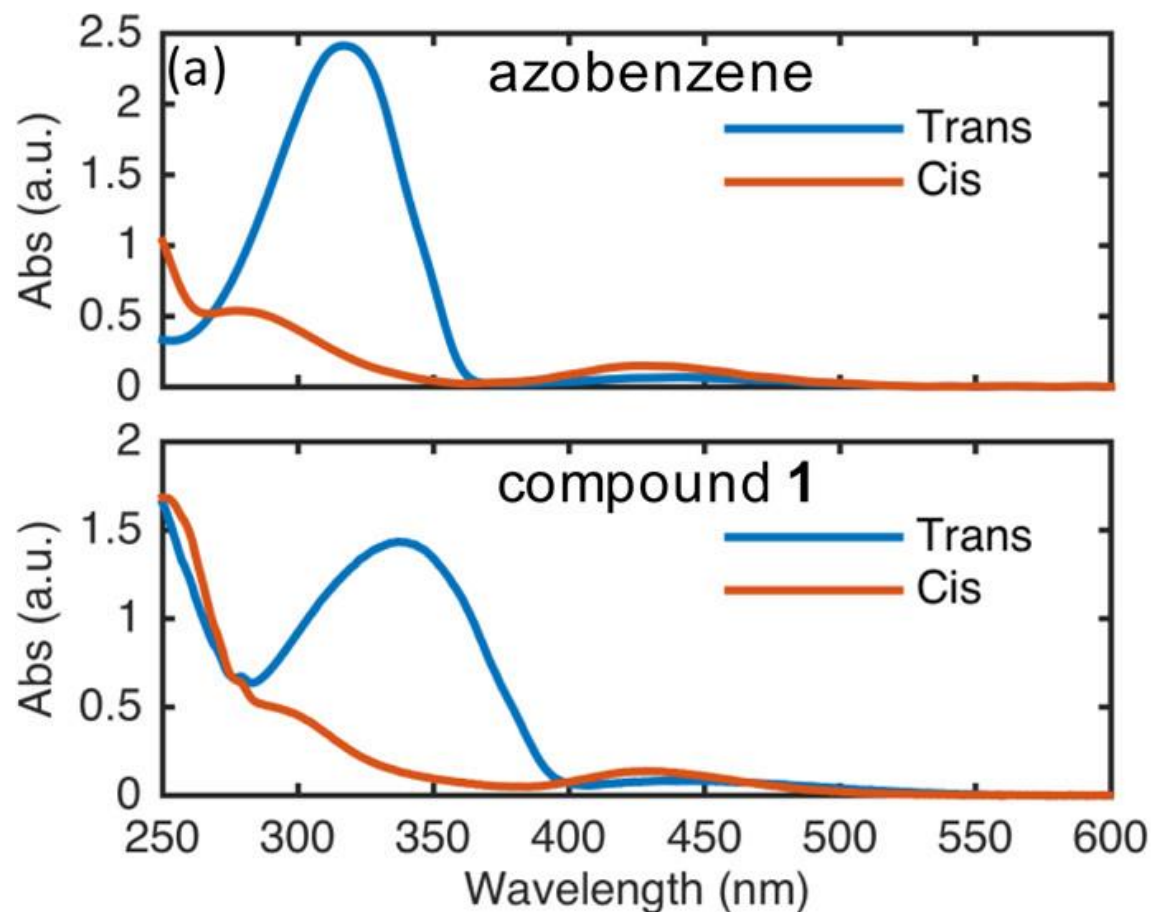

Gregory King and Arie Warshel., *The Journal of Chemical Physics*, 1990, **93**, 8682

Application to oxidation half reactions

Blumberger, J.; Tavernelli, I.; Klein, M. L.; Sprik, M., *The Journal of Chemical Physics*, 2006, **124**, 064507.
